# Paclitaxel-Coated Balloon Angioplasty Versus Drug-Eluting Stent in Acute Myocardial Infarction.

The REVELATION Randomized Trial. JACC 2019.

- 120 pts STEMI, FFR à 9 mois.
- At 9 months after enrolment, the mean fractional flow reserve value was  $0.92 \pm 0.05$  in the DCB group (n:35) and  $0.91 \pm 0.06$  in the DES group (n : 38) ( $p = 0.27$ ).
- One abrupt vessel closure requiring treatment occurred after treatment with DCB.
- Up to 9-months follow-up, 2 patients required non urgent target lesion revascularization (1 in each group).

# TiNAN / OPTIMAX: Stent Biologiquement-Actif (BAS)

## Etudes in Vitro

- Réduction du phénomène inflammatoire <sup>1</sup>
- Amélioration de la biocompatibilité <sup>1</sup>
- Réduction de l'agrégation plaquettaire et de la croissance fibreuse <sup>2</sup>
- Accélération du phénomène de réendothélialisation <sup>3</sup>
- Réduction du processus thrombotique <sup>4</sup>
- Présence de NO de surface <sup>5</sup>

Profils du Stent Bioactif Optimax

Le stent TITAN OPTIMAX dispose d'une plateforme en cobalt-chrome. Son revêtement bioactif en oxytitanure de titane (Ti-NO) se caractérise par la présence de particules de NO à la surface du stent, permettant une cicatrisation rapide dès 2 semaines mis en évidence par OCT ce qui a fait l'objet d'une publication. Plusieurs autres mécanismes sous-tendent l'action biologique du Ti-NO : inhibition de l'agrégation plaquettaire, moindre croissance de la fibrine, diminution de la formation de thrombus et réduction de l'inflammation. Chez les patients instables en Syndrome Coronarien Aigu (STEMI/NSTEMI), 3 études randomisées TIDES-ACS (Optimax vs. DES 3<sup>rd</sup> Generation), BASE-ACS (TITAN2 vs. DES 2<sup>nd</sup> Generation) et TITAX-AMI (TITAN vs. DES 1<sup>st</sup> Generation) ont documenté les performances de la technologie de coating Bio-Actif Ti-NO sur 2743 patients.

## Coating renforcé

- Plus forte concentration d'Oxynitride de Titane
- Moins thrombogène
- Ré-endothélialisation plus rapide

# Causes of DES Thrombosis

- *The polymer* (hypersensitivity reactions, inflammatory and thrombogenic) !
- *The drug* (delayed healing and incomplete late stent apposition)
- *The procedure* (suboptimal stent deployment and in/outflow problems)
- *The patient* (anti-platelet resistance, intrinsic thrombogenicity and more complex lesions)

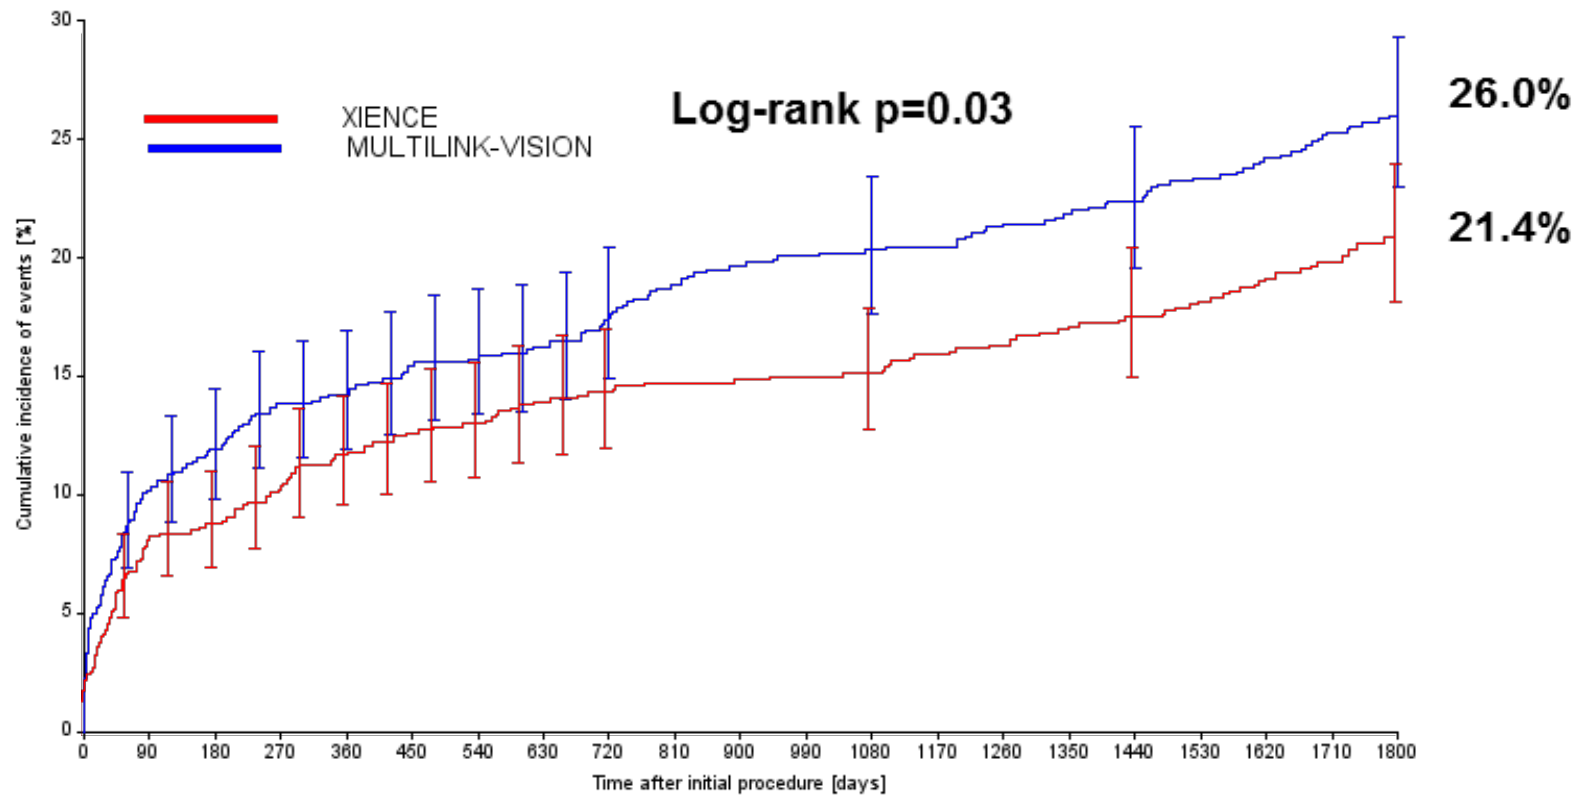

Increased sensitivity to obligatory prolonged dual antiplatelet regimens

# Everolimus-eluting stents versus bare-metal stents in ST-segment elevation myocardial infarction. Five-year results of the EXAMINATION Trial

*Manel Sabaté*  
*on behalf of the EXAMINATION investigators*

*Lancet 2015*

# Patient-oriented endpoint (all-cause death, any myocardial infarction or any revascularization)

# Lancet 2016

**“There were six prespecified secondary outcomes, of which five were reported in the article and one was not. Additionally, the Article reports the prespecified primary composite outcome at four additional non-prespecified timepoints; and ten new outcomes that were not prespecified, reporting eight of these at five timepoints each. None of these novel outcomes is adequately declared as non-prespecified...”**

**Everolimus-eluting stent versus bare-metal stent in  
ST-segment elevation myocardial infarction (EXAMINATION):  
1 year results of a randomised controlled trial** Lancet 2012; 380: 1482-90

Table 3 presents outcomes at 30-day and 1-year follow-up. The patient-oriented primary endpoint occurred in 89 (11.9%) patients of the EES group and 106 (14.2%) patients of the BMS group (figure 2A and table 3). Hence, the superiority hypothesis was not met for this global primary endpoint. The rates for the individual components of the primary endpoint were similar to those for the composite endpoint between the two groups (table 3). The findings for the primary endpoint were consistent across prespecified stratified analyses (appendix).

**L'objectif de SUPERIORITE n'a pas été atteint.**

## COMFORTABLE AMI

### \* Control device

The Gazelle is a BMS consisting of a similar stainless steel platform to that of the BioFreedom stent, but without the texturing of the abluminal surface. It is laser-cut from a stainless steel tube. Each corrugated ring has a total of six serially connected segments. The stent rings are connected by two short flexible links with successive pairs of these oriented in a 90° quadrature around the circumference of successive rings. The strut thickness is 120 μ. The stent has been shown to be associated with good angiographic and clinical results, comparable with other BMS, and had a late angiographic in-stent loss of  $0.86 \pm 0.56$  mm at 6 months.<sup>28</sup> In addition, it served as the BMS control in the recently published COMFORTABLE trial.<sup>29</sup> Its use in the present trial will allow for the intended double-blind design, thus avoiding any potential imbalance for the duration of DAPT during follow-up.

### Limitations

The use of the Gazelle BMS in the control arm is critical to ensure a double-blinded design. Although data on direct comparisons with other BMS are not available, it is possible that other BMS with thinner struts could be associated with a lower incidence of TLR.<sup>34</sup>

BES better      SES better

# Ce qu'on veut ns faire croire...

## Ce que l'on ne dit pas...

- Aujourd'hui, les Guidelines recommandent un virage à 180 degrés dans l'infarctus (STEMI/NSTEMI) en faisant la promotion du TOUT DES.
- Sur quelles preuves ?
- Peu/pas d'étude dans le NSTEMI...
- 2 gdes études dans le STEMI (EXAMINATION=> endpoint primaire non atteint, problèmes méthodologiques et COMFORTABLE AMI=> stent nu comparateur de 120 microns)
- IVUS à 5 ans ds COMFORTABLE AMI (2.1% vs 0.15%)

## NSTEMI

The safety and efficacy of DES have not been prospectively tested in a specific population of patients with NSTEMI-ACS, but this subset comprises up to 50% of patients included in most stent trials particularly those with an all-comer design. There is no particular safety concern in NSTEMI-ACS as new-generation DES have shown superior safety and efficacy in both SCAD and STEMI patients. Accordingly, new-generation DES are preferred over BMS as the default option.<sup>196</sup> Dual antiplatelet therapy (DAPT) should be maintained for 12 months, irrespective of stent type.

# TIDES-ACS MACE at 12 months

Event rate (%)

Definite stent thrombosis: 1.0% for BAS and 2.0% for EES (p=0.15)

# TIDES-ACS MACE at 18 months

Event rate (%)

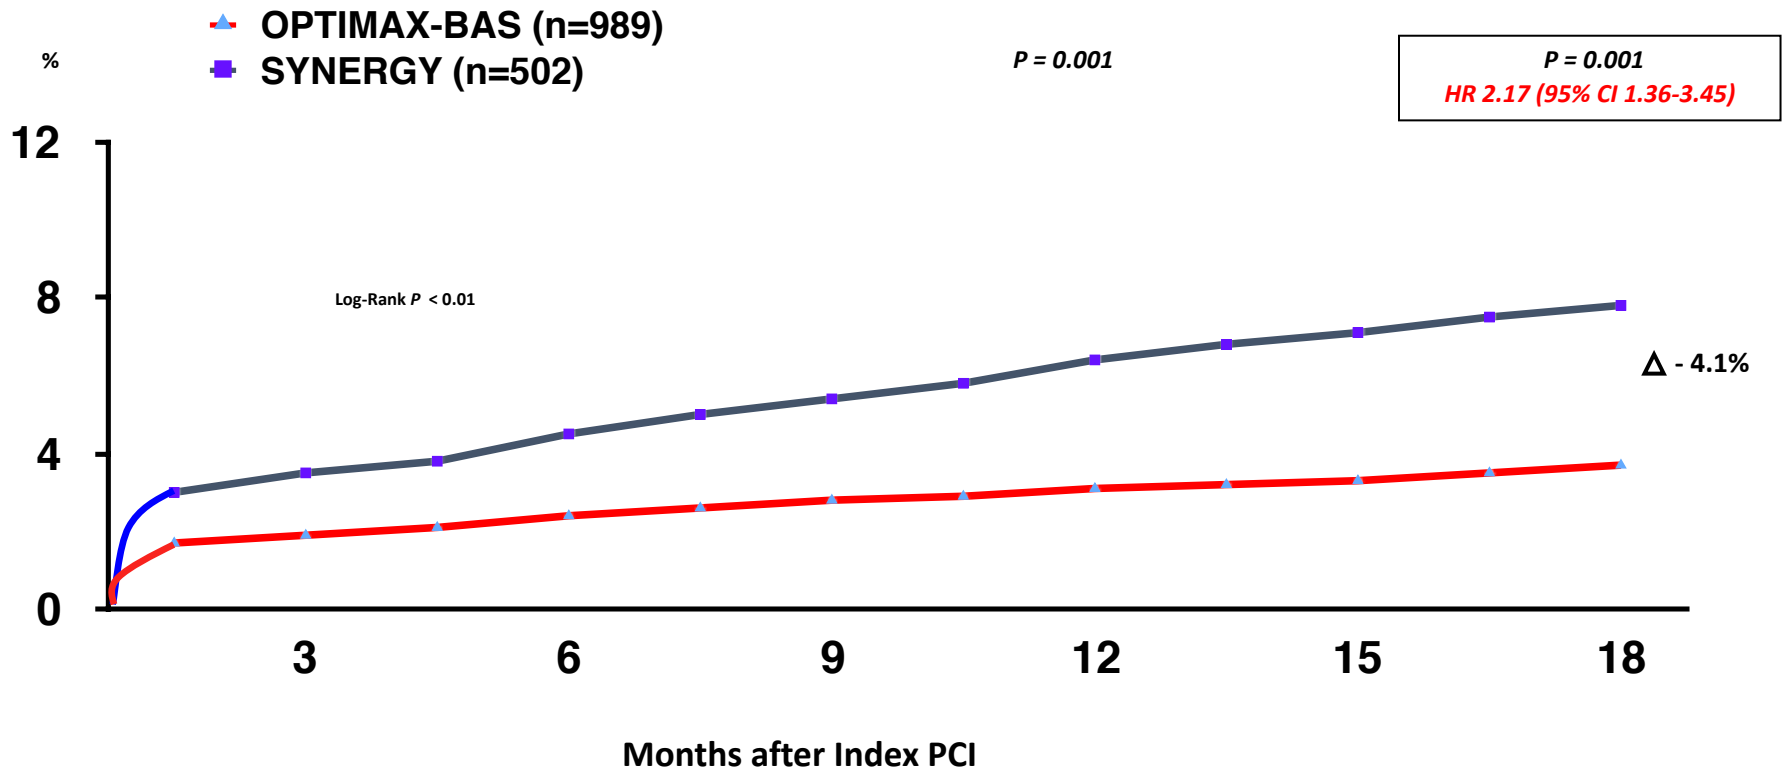

# TIDES-ACS other events at 18 months

Event rate (%)

# TIDES-ACS

Co-primary endpoint at 18 months

\* Co-primary endpoint = myocardial infarction (MI), cardiac death and major bleeding

# Conclusions

Le stent bioactif OPTIMAX **n'est pas inférieur** au stent délivrant de l'Évérolimus (SYNERGY) pour le 1<sup>er</sup> critère composite (mortalité cardiaque, infarctus, TLR).

Le stent bioactif OPTIMAX **apparaît supérieur** au stent délivrant de l'Évérolimus (SYNERGY) pour le 2<sup>ème</sup> critère composite (mortalité cardiaque, infarctus, hémorragie majeure).

Le stent bioactif semble une **excellente alternative** au DES ds la prise en charge des ACS...; pensez aux avantages de la ré-endothélialisation rapide et homogène...

- **L'étude TIDES ACS se heurte à une opposition de l'industrie (US ?? et autres) et n'est toujours pas publiée par... mépris... ?**
- **En l'état une métaanalyse réalisée par F. Daoud (Pessac), présentée à l'AHA 2018 (montrant – de thrombose de stent à 1 an et 5 ans), est dans le même état que TIDES ACS...**
- **Il faudrait peut-être réagir en justifiant que les équipes qui font confiance à la France doivent soutenir son industrie dans des indications bien précises...**
- **J'ai connu des français plus chauvins...**
